Plants make up 99.9 percent of the world's living matter, provide food and shelter, and control the Earth's climate. The study of plant ecology is therefore essential to understanding the biological functions and processes of the biosphere. This vibrant introductory textbook integrates important classical themes with recent ideas, models and data. The book begins with the origin of plants and their role in creating the biosphere as the context for discussing plant functional types and evolutionary patterns. The coverage continues logically through the exploration of causation with chapters, amongst others, on resources, stress,

competition, predation, and mutualism. The book concludes with a chapter on conservation, addressing the concern that as many as one-third of all plant species are at risk of extinction. Each chapter is enriched with striking and unusual examples of plants (e.g., stone plants, carnivorous plants) and plant habitats (e.g., isolated tropical tepui, arctic cliffs). Paul Keddy writes in a lively and thought-provoking style which will appeal to students at all levels.

This report finds that Europe is not doing enough to protect itself from the threats to water resources in large parts of the continent. Urgent action is required to safeguard water quality and availability in the UK and many areas of Europe which are already suffering from the effects of a significant lack of rain. The Government should bring forward the deadline for reforming the water abstraction regime, outlined in its Water White Paper ('Water for life', Cm. 8230, ISBN 9780101823029). More than 10% of rivers are abstracted to an extent that may damage water ecosystems, but the Government has set a target of the mid to late 2020s for reforming the regime, which fails to respond to the urgency of the situation. Other recommendations include: the EU must start planning immediately for a future in which water resources will be increasingly uncertain; the Government must allow the cost of water to increase where other measures to tackle water scarcity have failed; more must be done to promote the catchment level as an important level of governance, in the Blueprint for the future of the EU's water resources (due later this year); local stakeholders (for example, rivers trusts, amenity groups, anglers and farmers) should be allowed to play a much greater role in decisions

on issues such as river catchments, in order to reconnect people with the value of water as a resource; and the EU should encourage all Member States to develop national water scarcity and drought management plans.

Policy based systems are the subject of a wide range of activities in universities, standardisation bodies, and within industry. They have a wide spectrum of applications ranging from quality of service management within networks to security and enterprise modelling. This Lecture Notes volume collects the papers presented at the workshop on Policies for Distributed Systems and Networks held at the Hewlett-Packard Laboratories in Bristol, UK in January 2001. After a rigorous review process 16 papers were selected from 43 submissions. Within the Internet community there is considerable interest in policy based networking. A number of companies have announced tools to support the specification and deployment of policies. Much of this work is focused on policies for quality of service management within networks and the Internet Engineering and Distributed

Management Task Force (IETF/DMTF) is actively working on standards related to this area. The security community has focused on the specification and analysis of access control policy which has evolved into the work on Role-Based Access Control (RBAC). There has been work over a number of years in the academic community on specification and analysis of policies for distributed systems mostly concentrating on authorisation policies. Although there are strong similarities in the concepts and techniques used by the different communities there is no commonly accepted terminology or notation for specifying policies.

Social entrepreneurship is a growing area, and we frequently hear of new ventures committed to social change. In academia, however, social entrepreneurship has typically been taught as a 'version' of entrepreneurship, ignoring the unique structure, challenges and goals of the social venture. In their new book, Coleman and Kariv draw on the latest theory and research to provide boundaries to the definition of social entrepreneurship, discussing both what it is, and what it is not. The book answers several key questions: Who are social entrepreneurs? What is the process for identifying and solving a social need? What are the differences between for-profit and not-for-profit social ventures? What is the role of innovation? How do we develop high performing firms? How do we measure success? The focus on context allows students to appreciate how social entrepreneurship develops and operates in different countries and cultures, lending a global perspective to the book. Combined with rich pedagogy and a

companion website, it provides students with all the learning tools they need to grasp this important subject.

Sustainability and Water Management in the Maya World and Beyond investigates climate change and sustainability through time, exploring how political control of water sources, maintenance of sustainable systems, ideological relationships with water, and fluctuations in water availability have affected and

been affected by social change. Contributors focus on and build upon earlier investigations of the global diversity of water management systems and the successes and failures of their employment, while applying a multitude of perspectives on sustainability. The volume focuses primarily on the Precolumbian Maya but offers several analogous case studies outside the ancient Maya world that illustrate the pervasiveness of water's role in sustainability, including an ethnographic study of the sustainability of small-scale, farmer-managed irrigation systems in contemporary New Mexico and the environmental consequences of Angkor's growth into the world's most extensive preindustrial settlement. The archaeological record offers rich data on past politics of climate change, while epigraphic and ethnographic data show how integrated the ideological, political, and environmental worlds of the Maya were. *While Sustainability and Water Management in the Maya World and Beyond* stresses how lessons from the past offer invaluable insight into current approaches of adaptation, it also advances our understanding of those adaptations by making the inevitable discrepancies between past and present climate change less daunting and emphasizing the sustainable negotiations between humans and their surroundings that have been mediated by the changing climate for millennia. It will appeal to students and scholars interested in climate change, sustainability, and water management in the archaeological record.
