This volume makes a timely intervention into a field which is marked by a shift from unipolar to multipolar order and a pluralization of constitutional law. It addresses the theoretical and epistemic foundations of Southern constitutionalism and discusses its distinctive themes, such as transformative constitutionalism, inequality, access to justice, and authoritarian legality. This title has three goals. First, to pluralize the conversation around constitutional law. While most scholarship focuses on liberal forms of Western constitutions, this book attempts to take comparative law's promise to cover all major legal systems of the world seriously; second, to reflect critically on the epistemic framework and the distribution of epistemic powers in the scholarly community of comparative constitutional law; third, to reflect on - and where necessary, test - the notion of the Global South in comparative constitutional law. This book breaks down the theories, themes, and global picture of comparative constitutionalism in the Global South. What emerges is a rich tapestry of constitutional experiences that pluralizes comparative constitutional law as both a discipline and a field of knowledge.

This volume contains the edited papers prepared by lecturers and participants of the NATO Advanced Study Institute on "Statistical Treatments for Estimation of Mineral and Energy Resources" held at Il Ciocco (Lucca), Italy, June 22 - July 4, 1986. During the past twenty years, tremendous efforts have been made to acquire quantitative geoscience information from ore deposits, geochemical, geophys ical and remotely-sensed measurements. In October 1981, a two-day symposium on "Quantitative Resource Evaluation" and a three-day workshop on "Interactive Systems for Multivariate Analysis and Image Processing for Resource Evaluation" were held in Ottawa, jointly sponsored by the Geological Survey of Canada, the International Association for

Mathematical Geology, and the International Geological Correlation Programme. Thirty scientists from different countries in Europe and North America were invited to form a forum for the discussion of quantitative methods for mineral and energy resource assessment. Since then, not only a multitude of research projects directed toward quantitative analysis in the Earth Sciences, but also recent advances in hardware and software technology, such as high-resolution graphics, data-base management systems and statistical packages on mini and micro-computers, made it possible to study large geoscience data sets. In addition, methods of image analysis have been utilized to capture data in digital form and to supply a variety of tools for characterizing natural phenomena.
