When asked to describe this text, most Lipsey readers use the same word: precise. The authors do not gloss over subjects when presenting economic ideas; rather, they offer a patient explanation of the concept and back it up with the latest research and data. Taken separately, neither theory nor data alone can give readers a true understanding of the idea, but when combined these elements give students a complete view of economics in the real world. What is Economics?: Economic Issues and Concepts; How Economists Work. An Introduction to Demand and Supply: Demand, Supply, and Price; Elasticity; Markets in Action. Consumers and Products: Consumer Behavior; Producers in the Short Run; Producers in the Long Run. Market Structure and Efficiency: Competitive Markets; Monopoly, Cartels, and Price Discrimination; Imperfect Competition and Strategic Behavior; Economic Efficiency and Public Policy. Factor Markets: How Factor Markets Work; Labor Markets; Interest Rates and the Capital Market. Government in the Market Economy: Market Failures and Government Intervention; The Economics of Environmental Protection; Taxation and Public Expenditure. This book examines the long term economic growth that has raised the West's material living

standards to levels undreamed of by counterparts in any previous time or place. The authors argue that this growth has been driven by technological revolutions that have periodically transformed the West's economic, social and political landscape over the last 10,000 years and allowed the West to become, until recently, the world's only dominant technological force. Unique in the diversity of the analytical techniques used, the book begins with a discussion of the causes and consequences of economic growth and technological change. The authors argue that long term economic growth is largely driven by pervasive technologies now known as General Purpose (GPTs). They establish an alternative to the standard growth models that use an aggregate production function and then introduce the concept of GPTs, complete with a study of how these technologies have transformed the West since the Neolithic Agricultural Revolution. Early modern science is given more importance than in most other treatments and the 19th century demographic revolution is studied with a combination of formal models of population dynamics and historical analysis. The authors argue that once sustained growth was established in the West, formal models can shed much light on its subsequent behaviour. They build non-conventional, dynamic, non-stationary equilibrium models of GPT-driven growth that incorporate a range of phenomena that their historical studies show to be important but which are excluded from other GPT models in the interests of analytical tractability. The book concludes with a study of the policy implications that follow from their unique approach.
