Frank Marshall (1877-1944) reigned as America’s chess champion from 1907 through 1936—the longest stint of anyone in history. A colorful character almost always decked out in an ascot and chewing a cigar, his career coincided with many evolutionary changes in competitive chess.

Marshall was a master gamesman. He took up the game of salta, akin to Chinese checkers, and was soon world champion. But more than anything, he loved chess, claiming that after he learned the game at 10 he played every day for the next 57 years. Marshall’s life and playing style are fully examined here, including 220 of his games (some never before published) with 190 positional diagrams.

Reveals the evidence of life beyond death • Examines 125 years of scientific research into reincarnation, apparitions, and communication with the dead showing these phenomena are real • Reveals the existence of higher planes of consciousness where the souls of the dead can choose to advance or manifest once again on Earth • Explains how these findings have been ignored and denied because they are incompatible with materialist doctrines In this book, Chris Carter shows that evidence of life beyond death exists and has been around for millennia, predating any organized religion. Focusing on three key phenomena—reincarnation, apparitions, and communications from the dead—Carter reveals 125 years of documented scientific studies by independent researchers and the British and American Societies for Psychical Research that rule out hoaxes, fraud, and hallucinations and prove these afterlife phenomena are real. The author examines historic and modern accounts of detailed past-life memories, visits from the deceased, and communications with the dead via medium and automatic writing as well as the scientific methods used to confirm these experiences. He explains how these findings on the afterlife have been ignored and denied because they are incompatible with the prevailing doctrine of materialism. Sharing messages from the dead themselves describing the afterlife, Carter reveals how consciousness exists outside the parameters of biological evolution and emerges through the medium of the brain to use the physical world as a springboard for growth. After death, souls can advance to higher planes of consciousness or manifest once again on Earth. Carter’s rigorous argument proves—beyond any reasonable doubt—not only that consciousness survives death and continues in the afterlife, but that it precedes birth as well.

Have you ever wished for a “formula” to help you decide what move to make in any given chess position? In this ambitious and groundbreaking work, physicist and chess master Alexander Shashin presents the fruit of three decades of research into the elements of the game. He breaks down the position into mathematical ratios that compare the fundamental factors of material, mobility, safety, and space for each side, leading you to the proper plan and the mental attitude to adopt in light of what’s happening on the board. Relying on the games of three world champions with distinctive playing styles – Tal, Capablanca, and Petrosian – and backed up by personal and computer-aided analysis, *Best Play* explains how Shashin’s approach works in practice to guide your decisions in all kinds of situations, including those too wild and murky to provide clear-cut conclusions. Some 125 high-level examples are followed by 125 exercises with solutions to help you learn the method. Not just a textbook for the chess scientist to ponder in the lab, *Best Play* offers a fully formed philosophy of the game to prepare the chess warrior for any kind of battle.

Chess in the Fast Lane! Can anyone play a decent game of chess in one minute? Surprisingly, the answer is "Yes" as this unique book reveals. "Bullet" chess, where each player has one minute for the entire game, has attracted thousands of followers since it was popularized on the internet a decade ago. In this book the authors discuss the relationship between the position on the board and time on the clock, the techniques and dangers of "pre-

moving,” bullet openings, the importance of the initiative and consistent strategy, and how endings are different in bullet chess. The authors also explore the psychology of bullet chess and the most common causes of tactical oversights and blunders. The many examples illustrate the principles of bullet chess and how they may even apply to blitz chess and time scrambles in standard chess. Most of all, bullet chess is shown to be entertaining and addictive, and not at all as random as it first appears.

A Variation by Any Other Name... One of the most popular – and intriguing – variations of the Sicilian Defense is the so-called Chelyabinsk Variation. In the West, it is known as the Sveshnikov Variation, while older opening monographs may refer to it as the Lasker-Pelikan Variation. It is called the Chelyabinsk Variation in Russia. It is the variation that arises after 1.e4 c5 2.Nf3 Nc6 3.d4 cxd4 4.Nxd4 Nf6 5.Nc3 e5. Once dismissed by theoreticians as “anti-positional,” it is now common at all levels. In this monumental work, grandmaster Gennadi Timoshchenko, one of the creative founders of the entire line, puts the entire variation into both a personal and historical perspective and then examines the theory and practice of this line in great detail. From the foreword by Garry Kasparov: “Timoshchenko’s book on the Chelyabinsk Variation is both very interesting and necessary. Behind it lies an enormous amount of work, as will become evident as you read and especially play through the author’s analysis. Readers will be able to get a definitive insight into the genesis of the Chelyabinsk Variation...In its 200 chapters, more or less every important branch of the Chelyabinsk Variation is examined. It is also unusual as it contains a huge amount of novelties at various levels of importance.” Extraordinary analytical depth, cross-checked by strong engines, is complemented by historical and biographical perspectives to make this a truly unique opening manual. Regardless of what name you give it, Sicilian Defense: The Chelyabinsk Variation will provide you with a powerful weapon against 1.e4.

In the twenty-first century, we are just beginning to understand more clearly the enormous diversity and complexity of signaling processes in the

retina. Integrating advances in the biochemistry, cell biology, physiology, and physics of phototransduction, *Signal Transduction in the Retina* presents the methodologies and experimental approaches that yield key information on the mechanisms underlying normal retinal physiology. This in-depth work discusses the latest techniques and applications for understanding retinal function and degradation, developing novel therapeutic strategies, and promoting cellular survival and functional retention. Drawing contributions from experts in a range of disciplines, each chapter presents a brief overview of the area discussed along with specific methodology for obtaining the primary data to understand the cellular and molecular process. Given the dominance and wealth of information on rhodopsin-based phototransduction, the book devotes substantial attention to this topic, but also evaluates a diversity of signaling mechanisms. Beginning with the molecular mechanisms of vertebrate phototransduction, this volume presents the structure of phototransduction cascade components at atomic resolution, as well as molecular interactions in multi-protein complexes and novel cell-based strategies for understanding signal shut-off and light adaptation. It discusses non-visual phototransduction and the role of melanopsin in adaptive photoresponses and circadian clock regulation. The book also compares the visual signaling processes of vertebrates and invertebrates. It examines experimental studies of insulin-based signaling in the inner and outer retina; investigates retinal development including signaling in progenitor cells, cell-cell communication in developing cells, and neovascularization; and studies lipid-derived mediators such as neuroprotectins and discusses the participation of retinal pigment epithelium in neuronal survival.
