George Simling has grown up in the city-state of Illyria, an enclave of logic and reason founded as a refuge from the Reaction, a wave of religious fundamentalism that swept away the nations of the twenty-first century. Yet to George, Illyria's militant rationalism is as stifling as the faith-based superstition that dominates the world outside its walls. For George has fallen in love with Lucy. A prostitute. A robot. She might be a machine, but the semblance of life is perfect. To the city authorities, robot sentience is a malfunction, curable by erasing and resetting silicon minds. But George knows that Lucy is something more. His only alternative is to flee Illyria, taking Lucy deep into the religious Outlands where she must pass as human because robots are seen as mockeries of God, burned at the stake, dismembered, crucified. Their odyssey leads them through betrayal, war and madness, ending only at the monastery of the Holy Machine...

Risk-based ship design is a new scientific and engineering field of growing interest to researchers, engineers and professionals from various disciplines related to ship design, construction, operation and regulation. The main motivation to use risk-based approaches is twofold: implement a novel ship design which is considered safe but - for some formal, regulatory reason - cannot be approved today and/or rationally optimize an existing design with respect to safety,

without compromising on efficiency and performance. It is a clear direction that all future technological and regulatory (International Maritime Organisation) developments regarding ship design and operation will go through risk-based procedures, which are known and well established in other industries (e.g. nuclear, aviation). The present book derives from the knowledge gained in the course of the project SAFEDOR (Design, Operation and Regulation for Safety), an Integrated Project under the 6th framework programme of the European Commission (IP 516278). The book aims to provide an understanding of the fundamentals and details of the integration of risk-based approaches into the ship design process. The book facilitates the transfer of knowledge from recent research work to the wider maritime community and advances scientific approaches dealing with risk-based design and ship safety.

*The Infrastructural City* Actar/birkhauser Newman and Newman use a life-stage approach to present development across the life span, drawing on the psychosocial theory of Erik Erikson to provide a conceptual framework for the text. The authors address physical, intellectual, social, and emotional growth in 11 life stages, from the prenatal period through elderhood, focusing on the idea that development results from the interdependence of these areas at every stage, and placing special emphasis on how optimal development may be fostered throughout life. Updated with new research findings throughout, **DEVELOPMENT THROUGH LIFE: A PSYCHOSOCIAL APPROACH**, 13th Edition, provides a balanced view of normative patterns of development and diverse pathways, considering individual, family, cultural and societal factors that contribute to the diversity of life stories. Once the greatest American example of a modern city served by infrastructure, Los Angeles is now in perpetual crisis. Infrastructure has ceased to support its urban plans, subordinating architecture to its own purposes. This out-of-control but networked world is increasingly organized by flows of objects and information. Static structures avoid being superfluous by joining this system as temporary containers for people, objects, and capital. This provocative collection of photography, essays, and maps looks at infrastructure as a way of mapping our place in the city and affecting change through architecture.
