Today, enzyme technology, amalgamating enzymology with biotechnology, has become a household name in practically all branches of the contemporary science and technology. The book *Principles of Enzyme Technology* provides an exhaustive presentation of enzyme technology. The text is organised into four parts out of which the first three are more inclined towards imparting the conceptual aspects of the subject, whereas the fourth part accentuates more on the escalating applications of enzymes in industry, be it food, textile or pharmaceutical. Thus, the book offers a balanced insight into the immense world of enzymes in a single readable volume. HIGHLIGHTS OF THE BOOK

- Inclusion of a chapter on Enzyme Engineering and Technology makes the book more future-oriented, highlighting the wonders that the modern science can make.
- The textual presentation is very lucid, illustrative and organised in a manner that it is not based solely on the complexity of the subject but also on its usefulness.
- Adequate number of references, listing of literature for further reading and problems (both multiple choice and thought based) given at the end of each chapter make the book an ideal tool for learning enzyme technology. Primarily intended as a text for the students of biotechnology, biochemistry and other life science branches, this book will be of immense use to

the professionals as well as researchers for teaching and references.

Interdisciplinary knowledge is becoming increasingly important to the modern scientist. This invaluable textbook covers bioanalytical chemistry (mainly the analysis of proteins and DNA) and explains everything for the non-biologist. Electrophoresis, mass spectrometry, biosensors, bioassays, DNA and protein sequencing are not necessarily all included in conventional analytical chemistry textbooks. The book describes the basic principles and the applications of instrumental and molecular methods. It is particularly useful to chemistry and engineering students who already have some basic knowledge about analytical chemistry. This revised second edition contains a new chapter on optical spectroscopy, and updated methods and new references throughout. Andreas Manz received the 2015 Inventor Award for "Lifetime Achievement" from the European Patent Office. Petra S Dittrich will be presented with the Heinrich-Emanuel-Merck Award 2015 at EuroAnalysis2015 Conference.

This book discusses the recent advances in the wastes recycling technologies to provide low-cost and alternative ways for nanomaterials production. It shows how carbon nanomaterials can be synthesized from different waste sources such as banana fibers, argan (*Argania spinosa*) seed shells, corn grains, camellia oleifera shell, sugar cane bagasse, oil palm (empty fruit bunches and leaves) and palm kernel shells. Several nanostructured metal oxides (MnO₂, Co₃O₄,....) can be synthesized via recycling of spent batteries. The recovered nanomaterials can be applied in many applications including: Energy (supercapacitors, solar cells, etc.) water treatments (heavy metal ions and dyes removal) and other applications. Spent battery and agriculture waste are rich

precursors for metals and carbon, respectively. The book also explores the various recycling techniques, agriculture waste recycling, batteries recycling, and different applications of the recycled materials.

This book will present the theory involved in wastewater treatment processes, define the important design parameters involved, and provide typical values of these parameters for ready reference; and also provide numerical applications and step-by-step calculation procedures in solved examples. These examples and solutions will help enhance the readers' comprehension and deeper understanding of the basic concepts, and can be applied by plant designers to design various components of the treatment facilities. It will also examine the actual calculation steps in numerical examples, focusing on practical application of theory and principles into process and water treatment facility design.
