This book aims to promote awareness of and highlight the screening modalities and various treatment options available for the management of cervical pre-invasive lesions. Cervical cancer is the leading cause of malignancy among women worldwide, and deaths due to cervical cancer represent a global health problem. Yet the risk of cervical malignancy can be decreased substantially if the premalignant conditions of the cervix are recognized and treated in a timely manner. Colposcopy is the gold standard for the diagnosis of cervical dysplasia. Accordingly, the book details the fundamentals of colposcopy and colposcopic assessment of the normal and abnormal cervix. With preventive oncology taking front stage, colposcopy has become one of the most important diagnostic tools available. With chapters contributed by respected experts in this field, the book offers vital insights into colposcopy and an essential guide to comprehensive strategies for the early detection of cervical cancer. The main text is complemented by ample illustrations for clarity and a better understanding of the subject. Case discussions on various clinical scenarios will further ensure good clinical practices, which will in turn translate into reduced risk of cervical cancer.

This text describes a system of reporting breast fine needle aspiration biopsy that uses five clearly defined categories, each described by a specific term and each with a specific risk of malignancy. The five categories are insufficient/inadequate, benign, atypical, suspicious of malignancy and malignant. Each category has a risk of malignancy and is linked to management recommendations, which include several options because it is recognized that diagnostic infrastructure, such as the availability of core needle biopsy and ultrasound guidance, vary between developed and low and middle income countries. This text includes key diagnostic cytological criteria for each of the many lesions and tumors found in the breast. The cytopathology of specific lesions is illustrated with high quality photomicrographs with clear figure descriptions. Chapters also discuss current and potential future ancillary tests, liquid based cytology, nipple cytology and management. An additional chapter provides an overview of an approach to the diagnosis of direct smears of breast fine needle aspiration biopsies. The International Academy of Cytology Yokohama System for Reporting Breast Fine Needle Aspiration Biopsy Cytopathology provides a clear logical approach to the diagnosis and categorization of breast lesions by FNAB

cytology, and aims to facilitate communication with breast clinicians, further research into breast cytopathology and related molecular pathology, and improve patient care.

The management of the pregnant woman with a medical problem presents the clinician with particular problems. An understanding of how a medical disease affects pregnancy and how any pre-existing medical condition is affected by pregnancy is required. In addition the clinician must take into account the second patient - the fetus - and be aware of how drug therapy and management strategies may influence fetal well-being. With tables, bullet points and boxes of key points, this text deals with the most common and serious medical conditions encountered in pregnancy, with a chapter for each system including heart disease, hypertension, thromboembolism, diabetes, skin problems, and gastrointestinal disease. With substantially updated chapters, this text is mainly in handy note form and concentrates on the differential diagnosis of common symptoms, signs and biochemical abnormalities encountered in pregnancy. *Professional Ethics in Obstetrics and Gynecology* Lippincott Williams & Wilkins

One in five people in the United States had a sexually transmitted infection (STI) on any given day in 2018, totaling nearly 68 million estimated infections. STIs are often asymptomatic (especially in women) and are therefore often undiagnosed and unreported. Untreated STIs can have severe health consequences, including chronic pelvic pain, infertility, miscarriage or newborn death, and increased risk of HIV infection, genital and oral cancers, neurological and rheumatological effects. In light of this, the Centers for Disease Control and Prevention, through the National Association of County and City Health Officials, commissioned the National Academies of Sciences, Engineering, and Medicine to convene a committee to examine the prevention and control of sexually transmitted infections in the United States and provide recommendations for action. In 1997, the Institute of Medicine released a report, The Hidden Epidemic: Confronting Sexually Transmitted Diseases. Although significant scientific advances have been made since that time, many of the problems and barriers described in that report persist today; STIs remain an underfunded and comparatively neglected field of public health practice and research. The committee reviewed the

current state of STIs in the United States, and the resulting report, Sexually Transmitted Infections: Advancing a Sexual Health Paradigm, provides advice on future public health programs, policy, and research.

Women suffer disproportionate rates of chronic disease and disability from some conditions, and often have high out-of-pocket health care costs. The passage of the Patient Protection and Affordable Care Act of 2010 (ACA) provides the United States with an opportunity to reduce existing health disparities by providing an unprecedented level of population health care coverage. The expansion of coverage to millions of uninsured Americans and the new standards for coverage of preventive services that are included in the ACA can potentially improve the health and well-being of individuals across the United States. Women in particular stand to benefit from these additional preventive health services. Clinical Preventive Services for Women reviews the preventive services that are important to women's health and well-being. It recommends that eight preventive health services for women be added to the services that health plans will cover at no cost. The recommendations are based on a review of existing guidelines and an assessment of the evidence on the effectiveness of different preventive services. The services include improved screening for cervical cancer, sexually transmitted infections, and gestational diabetes; a fuller range of contraceptive education, counseling, methods, and services; services for pregnant women; at least one well-woman preventive care visit annually; and screening and counseling for interpersonal and domestic violence, among others. Clinical Preventive Services for Women identifies critical gaps in preventive services for women as well as measures that will further ensure optimal health and well-being. It can serve as a comprehensive guide for federal government agencies, including the Department of Health and Human Services and the Center for Disease Control and Prevention; state and local government agencies; policy makers; health care professionals; caregivers, and researchers.
